Bounded Archimedean Lattice-Ordered $\mathbb{R}$-Algebras

Patrick Morandi
New Mexico State University

Abstract: The $\mathbb{R}$-algebra $C(X, \mathbb{R})$ of continuous real-valued functions on a topological space $X$ has been well studied. In the 1930s Stone proved that the category of compact Hausdorff spaces is dually equivalent to the category $C$ of such algebras. He also axiomatized these algebras as certain complete normed lattice-ordered $\mathbb{R}$-algebras. We will study a larger category $bal$, consisting of bounded Archimedean lattice-ordered $\mathbb{R}$-algebras. Each algebra in $bal$ is isomorphic to a lattice-ordered subalgebra of $C(X, \mathbb{R})$ for some compact Hausdorff space $X$.

In this talk we will motivate our study of the category $bal$ and give background on lattice-ordered algebras and the duality between compact Hausdorff spaces and rings of continuous functions. We will see that the category $C$ can be described as the unique reflective epicomplete subcategory of $bal$. We will also discuss some other interesting subcategories of $bal$.
