Form B

For each of the following problems at least one of the choices is correct. For many of the problems more than one of the choices is correct. Record your answers for each problem on the answer sheet (last page). Turn in (only) the answer sheet (with your answers on it) at the end of the exam. Do your own work. You may keep the exam for your own records.

1. (12 pts) Consider the following four systems of linear equations:

i. 
$$\begin{cases} 2x_1 + 2x_2 = -1 \\ -x_1 + 3x_2 = 2 \end{cases}$$
 ii. 
$$\begin{cases} x_1 - 2x_2 + 2x_3 = 0 \\ x_1 + 3x_3 = -2 \\ -x_1 + 2x_3 = 1 \end{cases}$$

iii. 
$$\begin{cases} x_1 + 2x_2 = -1 \\ -3x_1 - 6x_2 = 2 \end{cases}$$
 iv. 
$$\begin{cases} x_1 - x_2 + 2x_3 = -1 \\ x_1 + 2x_2 - x_3 = 0 \end{cases}$$

Which of the above fours systems of linear equations can be solved by Cramer's Rule?

2. (12 pts) Consider the set  $V = \{(x_1, x_2)^T \mid x_1, x_2 \in \mathbb{R}\}$ . Define "addition" by  $(x_1, x_2)^T \oplus (y_1, y_2)^T = (x_1 y_1, x_2 y_2)^T$ . (We will use symbol  $\oplus$  for "addition" since this is not the usual addition for order pairs.) Define scalar multiplication by  $\alpha(x_1, x_2) = (\alpha x_1, \alpha x_2)$ . (This is usual scalar multiplication for ordered pairs.)

Recall the vector space axioms for addition for a vector space V.

- i. Addition is commutative, i.e. for every x, y in V we have  $x \oplus y = y \oplus x$
- ii. Addition is associative, i.e., for every x, y, z in V we have  $(x \oplus y) \oplus z = x \oplus (y \oplus z)$
- iii. Existence of an additive identity in V, i.e. there exists an additive identity (called  $\mathbf{0}$ ) in V so that for every  $\mathbf{x}$  in V we have  $\mathbf{x} \oplus \mathbf{0} = \mathbf{x}$
- iv. Existence of additive inverses in V, i.e. for each x in V there exists an additive inverse (called -x) in V so that  $x \oplus -x = 0$

Which of the above axioms are **not** satisfied by V with its defined "addition" and scalar multiplication?
