

Math 2450: Applications of Multiple Integrals

We have explored how to properly set up multiple integrals over a specified domain, evaluate the integrals, and change the order of integration. Now we can apply those skills to calculate averages, areas between curves, surface areas, and volumes enclosed by a surface.

<p style="text-align: center;">Calculating Area of a Region</p> <p>The area of the region D in the xy-plane is given by</p> $A = \iint_D dA$ <p>Note: This reduces to the single integral case from Calc I after we evaluate the first integral. Using a double integral gives us the ability to change order of integration if necessary.</p>	<p style="text-align: center;">Calculating Volume of a Solid</p> <p>The volume of the solid region E is given by</p> $V = \iiint_E dV$ <p>Note: This reduces to the double integral formula (diagonal) after we evaluate the first integral.</p>
<p style="text-align: center;">Calculating Volume of a Bounded Solid</p> <p>When $f(x, y) \geq 0$ and continuous on a region D the volume of a solid bounded above by $z = f(x, y)$ and below by D in the xy-plane is given by</p> $V = \iint_D f(x, y) dA$	<p style="text-align: center;">Calculating the Total Mass of a Solid</p> <p>$f(x, y, z)$ is the density of a solid object D at a given point (x, y, z). The the total mass of the solid is given by</p> $\iiint_D f(x, y, z) dV$

<p>Average Values</p> <p>The average value of the continuous function f over R is given by:</p> <table style="width: 100%; border: none;"> <tr> <td style="text-align: center; width: 33%;">One Variable</td> <td style="text-align: center; width: 33%;">Two Variables</td> <td style="text-align: center; width: 33%;">Three Variables</td> </tr> <tr> <td style="text-align: center;">$\frac{1}{\text{length of segment } R} \int_R f(x) dx$</td> <td style="text-align: center;">$\frac{1}{\text{area of region } R} \iint_R f(x, y) dA$</td> <td style="text-align: center;">$\frac{1}{\text{volume of solid } R} \iiint_R f(x, y, z) dV$</td> </tr> </table>	One Variable	Two Variables	Three Variables	$\frac{1}{\text{length of segment } R} \int_R f(x) dx$	$\frac{1}{\text{area of region } R} \iint_R f(x, y) dA$	$\frac{1}{\text{volume of solid } R} \iiint_R f(x, y, z) dV$
One Variable	Two Variables	Three Variables				
$\frac{1}{\text{length of segment } R} \int_R f(x) dx$	$\frac{1}{\text{area of region } R} \iint_R f(x, y) dA$	$\frac{1}{\text{volume of solid } R} \iiint_R f(x, y, z) dV$				
<p style="text-align: center;">Surface Area</p> <p>Assume that the function $f(x, y)$ has continuous partial derivatives f_x and f_y in a region R of the xy-plane. Then the portion of the surface $z = f(x, y)$ that lies over R has surface area</p> $S = \iint_R \sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1} dA$ <p>We also have the case when the surface $y = f(x, z)$ is projected onto the region Q in the xz-plane. The formula for surface area becomes</p> $S = \iint_Q \sqrt{[f_x(x, z)]^2 + [f_z(x, z)]^2 + 1} dx dz$ <p>And similarly, for projection onto the region T in the yz-plane would have surface area</p> $S = \iint_T \sqrt{[f_y(y, z)]^2 + [f_z(y, z)]^2 + 1} dy dz$						
<p style="text-align: center;">Parametric Definition of Surface Area</p> <p>Let S be a surface defined parametrically by $\mathbf{R}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$ on the region D in the uv-plane, and assume that S is smooth in the sense that \mathbf{R}_u and \mathbf{R}_v are continuous with $\mathbf{R}_u \times \mathbf{R}_v \neq 0$ on D. Then the surface area, S, is defined by</p> $S = \iint_D \ \mathbf{R}_u \times \mathbf{R}_v\ du dv$ <p style="text-align: center;">The quantity $\ \mathbf{R}_u \times \mathbf{R}_v\$ is called the fundamental cross product.</p>
